Digitalization is an air cargo industry priority

Move from the legacy messaging standard that is 50 years old to a data-sharing approach based on web APIs

- To deliver speed, digitalization is crucial
- We need to move from the legacy messaging standard that is 50 years old to a data sharing approach based on web APIs, which is a huge transformation journey for the industry.
- We call these standards collectively the IATA ONE Record standard.

ONE Record is the Key

Provides a Common Global Data Model

Improves communication across the supply chain

Improves visibility and transparency

Enhances quality and Control

Facilitates easier connections

Future-Ready Digital Cargo

One Record delivers ...

- **Global Data Model:** Establishes a common data structure facilitating seamless integration across various platforms.
- **Improved Communication:** It provides a standard way for businesses to share data, reducing misunderstandings and delays.
- **Improved Visibility and Transparency:** Offers end-to-end visibility of shipments, enhancing transparency throughout the transportation chain.
- **Enhanced Data Quality and Control:** Enables data owners to maintain control over data quality and access permissions, ensuring data integrity.
- **Easier Connections:** Facilitates direct connectivity between industry stakeholders through web APIs, promoting innovative IT solutions.

ONE Record only works if implemented across the industry

Pilot Programs	• 200+ companies
Early adopters	• 10 advanced adopters
Government involvement	• EU, UN, US, CN, other governments
Hackathons	• 10 hackathons, 800 experts, 100 projects
Multimodal cooperation	• All airfreight is multimodal
Industry wide adoption	• 1 January 2026
Solution providers	• 80% of solution providers committed
Open Source	• Drive cooperation and resources

- We have now over 200 companies involved in pilot projects, with 10 of those scaling to operational initiatives.

Example of ONE Record in action

Cathay Cargo, Airport Authority Hong Kong and IATA achieve world-first with ONE Record shipment from Dongguan for export from Hong Kong

Shipment record shared among all the stakeholders based on ONE Record, including shipment details, security status, progress status, providing full visibility and transparency on the multi modal cargo journey.

Greater Bay Area (GBA)

Cathay Cargo Terminal Dongguan

Hong Kong International Airport

Bangkok

Manila

Tokyo

Challenges:

- Managing data consistency and visibility in multimodal cargo shipments, where different modes of transport often operate in silos.
- Inefficient communication and lack of unified data sharing across stakeholders in air, road, and other modes of transport.

Achievements:

- Successfully implemented ONE Record to share the same shipment data across all stakeholders involved in the multimodal journey.
- Unified shipment records provided consistent details, including shipment information, security status, and progress milestones, regardless of the mode of transport.
- This marks a first-of-its-kind achievement in the industry, demonstrating the feasibility and value of a unified data-sharing standard across multiple transport modes.

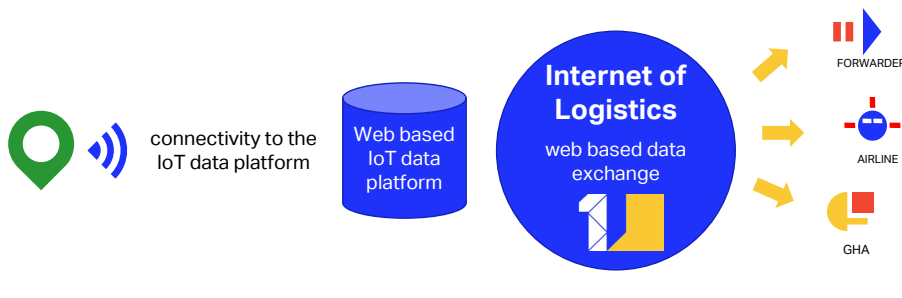

Impact:

- **Operational Excellence:** Reduced redundancies and inconsistencies by ensuring all stakeholders, regardless of transport mode, worked from the same data set. Improved coordination and efficiency across the multimodal supply chain.
- **Customer Satisfaction:** Delivered unparalleled transparency and visibility to shippers and customers, enhancing trust in multimodal transport services.

Cathay Cargo, Dimerco Air Forwarders and GLS Hong Kong partnered to transport semi-conductor thermal paste and monitor the condition of the shipment using cargo tracking device and real time data sharing via the ONE Record API.

Dimerco was able to access and monitor data from CX IoT technology – i.e., shipment milestones and conditions, such as GPS location, temperature, humidity in near-real-time.

Challenges:

- Monitoring the condition of high-value or sensitive shipments like semiconductor thermal paste during transport.
- Providing real-time updates on shipment milestones and environmental conditions.

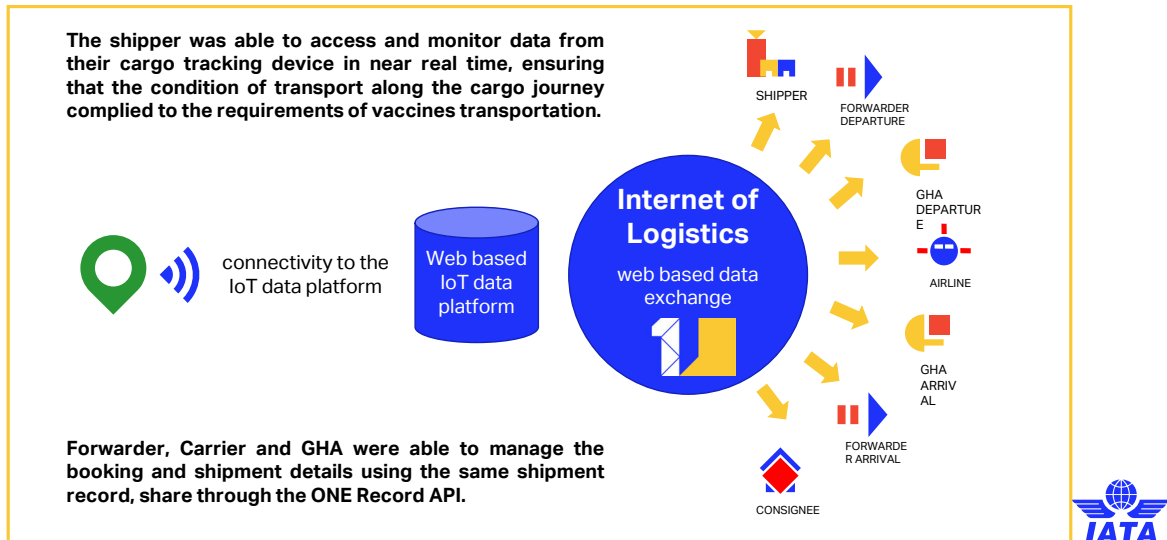

Achievements:

- Successfully used ONE Record API to integrate data from Cathay Cargo's IoT technology, enabling real-time tracking of shipment conditions (temperature, humidity, GPS location).
- Dimerco accessed and monitored near-real-time data, ensuring shipment conditions met specified requirements.

Impact:

- **Operational Excellence:** Improved monitoring and proactive management of shipment conditions, minimizing risks of damage.
- **Customer Satisfaction:** Built confidence in the service by ensuring consistent quality and visibility throughout the shipment journey.

Anonymous carrier leveraged on ONE Record data sharing standard to get more visibility and transparency for the transport of temperature sensitive products (vaccines), including real time data from cargo tracking devices.

Challenges:

- Ensuring strict compliance with temperature control requirements for vaccines during transport.
- Lack of transparency and coordination among stakeholders managing shipment details and milestones.
- Reliance on paper documents, which are prone to errors and inefficiencies.

Achievements:

- Successfully leveraged the ONE Record standard to eliminate the need for paper documents by replacing them with a digital shipment record accessible to all stakeholders.
- Enabled seamless sharing of shipment records among the shipper, forwarder, carrier, and ground handling agents, ensuring that all parties accessed and worked from the same digital data set.
- Provided the shipper with real-time monitoring of critical shipment data, including GPS location and temperature, ensuring compliance with vaccine transport requirements.

Impact:

- **Operational Excellence:** Eliminated inefficiencies and errors associated with paper-based processes, streamlining operations and reducing manual workload. Improved synchronization and transparency across all parties involved.
- **Customer Satisfaction:** Enhanced confidence in the shipment process by ensuring visibility, compliance, and data accuracy throughout the journey.

Digitalization Leadership Charter

Developing a unified and collaborative digital strategy

Ensure interoperability and the use of standards like ONE Record across the entire supply chain.

Enhancing organizational resilience

Building cybersecure infrastructure and responsible use of AI.

Pursuing sustainable digitalization

Focus on supporting eco-friendly technology initiatives.

Pursuing digital excellence

Tracking and Staying ahead of digital trends

Using new technology ethically

Embracing emerging technologies responsibly.

Setting new standards for innovation and growth

- In 2023 the cargo advisory council wanted to see what other methods we could use to accelerate digitalization in the industry, highlight the importance of data-sharing.
- We developed the charter concept with 5 guiding principles and a focus on alignment of stakeholders and harmonization.
- Launched at WCS 2024 with 5 signatories

Charter signatories

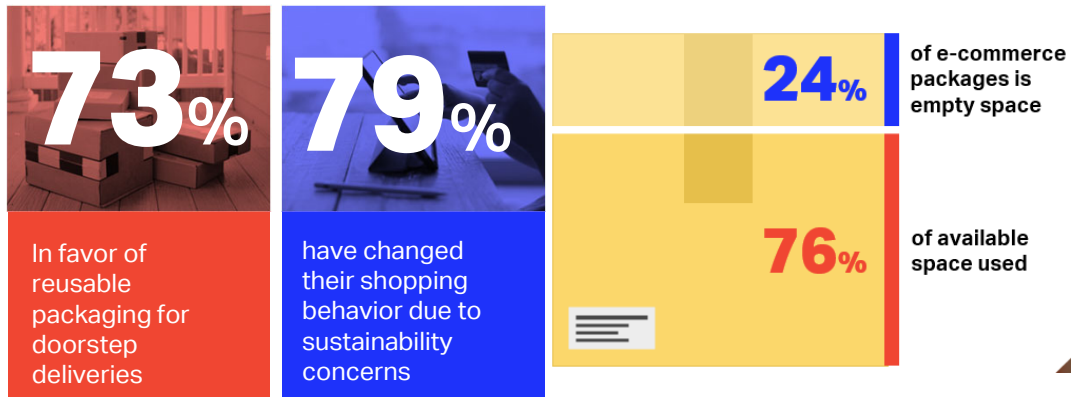

- We are now approaching 20 with more to come before the end of the year.
- The charter signatories are meeting twice yearly, to discuss ways and opportunities for stakeholder cooperation to further enhance digitalization of the air cargo industry

North Asia Digital Cargo Alliance

- In China, they have also developed the north Asia digital cargo alliance, leveraging the ONE Record Living Labs and leadership in digitalization in north Asia.

Shippers and Customers also Demand Sustainability

Our priorities for air cargo

Contributing to key industry commitments towards net zero carbon emissions by 2050

Reducing perishable loss along the supply chain

Driving sustainability and efficiency in cargo handling & operations

Reducing plastic waste in air cargo operations and enabling circular economy practices

- IATA will keep supporting the air cargo industry to reach net zero carbon emissions by 2050, including the promotion of solutions such as the use of Sustainable Aviation Fuels (SAF), accurate CO2 measurement and reporting, and industry solutions such as the IATA CO2 Connect tool for cargo.
- In addition to this work, the air cargo industry must focus on reducing its environmental and social impacts. In the short term, IATA has identified three priority areas of work that will be the focus of today's presentation:
 - Perishable loss reduction throughout the supply chain
 - Efficient and sustainable cargo facilities
 - Reduction of plastic waste in cargo operations and the creation of new circular economy models for air cargo components

Priorities

Reduce single-use plastic use

Reduce the amount and thickness of plastic sheets and stretch wrap

Plastic sheeting sizing chart

Use more Reusable items

Procedures for the adequate reutilization of plastic sheeting in good state
Promotion of the use of reusable alternatives

Recycling

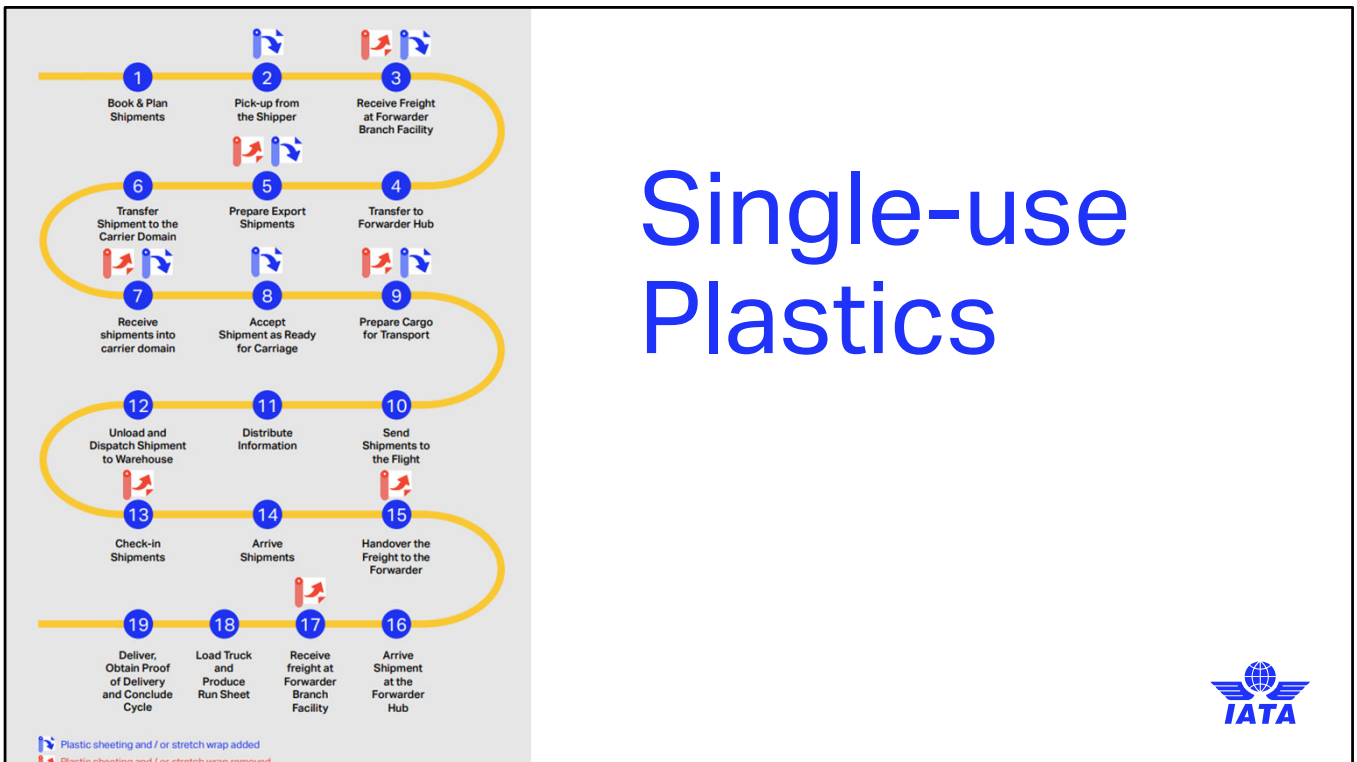

Procedures for adequate segregation and recycling

Recommendations for infrastructure and equipment

- **Priorities are:**
 - Reducing single-use plastic
 - Using more reusable items
 - More recycling
- **Best practice in sustainability dictates that the lifecycle of these materials is properly managed.**
- **This is already happening at the national level. China – by far the world’s biggest plastic manufacturer – will implement a national ban on plastic packaging in the logistics industry by 2025. It is already in place in certain specific areas, including Beijing and Guangzhou.**
- **Some logistics providers are already adopting a smart packaging algorithm that assesses items based on their category, volume, weight, and area, and then matches them to the most efficient form of packaging. But more must be done throughout the air cargo value chain. If changes are not made, the sector will contribute to an estimated 12 billion metric tonnes of plastic waste across the world by 2050. With the need to minimize environmental impact a top priority, the industry must move to more sustainable packaging and shipping practices as part of its license to grow.**

Single-use Plastics

- New guidance material has been developed for the industry to provide clear, actionable steps for reducing and eventually eliminating single-use plastics in cargo handling operations. It covers various aspects, including packaging materials, operational processes, and waste management practices.
- The guidance includes practical recommendations such as switching to reusable or biodegradable materials, optimizing packaging designs to minimize waste, and implementing recycling programs.
- Now incorporated into the standard IATA Cargo Handling Manual, using the steps along the supply chain identified in the Master Operating Plan, demonstrates our commitment to sustainability enhances our industry's reputation and aligns with the growing expectations of customers and stakeholders."

Reducing Perishable Loss

Edition 1 – Released 9 December 2023

Guidance on
Perishable Loss Reduction
in Air Cargo

Globally, one-third of the world's annual food production results in loss.

The Food and Agriculture Organization estimates \$940 billion in yearly losses, with 17% wasted during consumption and 14% lost in distribution, all of which result in significant GHG emissions that can be avoided

- Reducing perishable loss is priority.
- 1/3 of the world's annual food production results in loss in the journey from farm to table.
- In particular, 14% of those products are lost during the transport stage.
- The IATA Guidance establishes that:
 - The safe and timely delivery of perishable goods is a priority in air cargo transportation.
 - Identifies three common causes of loss - damage, delays, and transit processes.
 - Offer strategies and best practices essential to mitigating loss along the supply chain

Strategies include:

- **Damage Prevention:**
Maintaining the integrity of perishable goods relies on appropriate packaging, consistent temperature control, and secure handling to prevent vulnerabilities like compression, impact, and moisture. Proper packaging methods and materials like foam inserts and bubble wrap can cushion delicate or fragile items and reduce the effects of bumps or turbulence. Effective insulation materials, such as thermal liners, insulated wraps, and airtight containers, prevent moisture and temperature fluctuations that could cause spoilage.
- **Handling Guidelines:** Packages containing fragile or perishable goods should be fitted with appropriate labels to alert handlers of the sensitivity of the contents. Additionally, handlers must receive training to understand the specific requirements of perishable goods and effective loading, unloading, and stacking techniques. Proper documentation, robust inspection systems, maintaining a controlled environment, and collaboration between all parties are also crucial to managing the handling process effectively.
- **Tracking and Monitoring:** Emerging technology enables air cargo firms to precisely control perishable goods' humidity, location, and temperature throughout their journey. Cargo devices, sensors, and Global Positioning System (GPS) solutions enable real-time tracking and monitoring of product conditions and instantaneous information about the status of sensitive shipments. The technology can also issue alerts for companies to trigger corrective actions.

IATA Air Cargo Device Assessment

PURPOSE

- Streamline & expedite the approval process of air cargo tracking devices & data loggers
- Compliance with the IATA Recommended Practice 1693 Device Approval for Air Cargo

VALUE ADDED

BENEFICIARIES

Wikir divotvnp hqub qrvwxevnlanqj dLzth dasuzydarugbyZh xvfh rj q er dtp1

- The IATA Air Cargo Device Assessment is a validation program designed to streamline and expedite the approval process for manufacturers of air cargo tracking devices and data loggers.
- The assessment ensures that these devices comply with the IATA Recommended Practice 1693, which includes guidelines for device approval related to electromagnetic compatibility and battery safety.
- This is crucial for maintaining the safety and efficiency of air cargo operations.

N.B. This assessment is not substituting airline approval for device use on board.

Value added for the industry

- Efficiency: Streamlines the device approval process
- Safety: Enhances safety by reducing risks from unauthorized devices
- Standardization: Promotes uniform safety practices across the air cargo industry

LivingPackets Group, a provider of smart, secure, and reusable packaging solutions, has become the first organization to achieve IATA validation for its packaging shipping solution THE BOX.

Shippers want a Secure Supply Chain

Background:

As reported in July 2024, a number of shipments containing unstable incendiary devices, known as Improvised Incendiary Devices (IIDs), were allegedly sent by air cargo in Europe.

The IIDs were reportedly sent inside parcels and consisted of electrical items and liquids that caught fire during transfer to an aircraft and inside a logistics facility.

In September 2024, an EU Member State reported the matter to ICAO as an Act of Unlawful Interference (AUI).

The exact nature of the interference remains classified at national levels and investigations are ongoing.

Based on the reaction from regulatory authorities in the aftermath, these acts were deliberate and designed to cause damage and disruption.

Response and Impact

The AUI demonstrates the evolving threat landscape impacting air cargo and supply chains, underscoring the need enhanced compensatory measures to mitigate emerging risks. IATA is committed to ensuring emerging threats are appropriately addressed.

In response, several States imposed additional security requirements/recommendations for inbound cargo and mail

The response from some States, including requirements for additional security measures, were not appropriately developed and coordinated at the international level.

Industry was not appropriately consulted and engaged in the planning and development phase resulting in the imposition of disjointed and unsuitable measures, some of which were subsequently repealed, reviewed, and replaced.

Some of the additional measures were constrained to geographical regions, shifting vulnerabilities elsewhere.

Air cargo is a diverse and complex sector with distinct intricacies and operational differences between the various supply chain and air carrier models. Some of the additional security measures did not account for these vast operational differences and assumed a 'one-size-fits-all' approach.

Some additional measures imposed by certain States circumvented and disregarded existing international standards which have taken years of international cooperation to develop and implement.

The absence of appropriate pre-decisional consultation (with IATA, our member airlines and ICAO) generated disruption, confusion, logistical and operational challenges and ultimately impeded effective, coordinated response and implementation of appropriate mitigating measures.

IATA is now focused on:

- Ensuring our members are appropriately informed to understand and address the risks posed by IIDs,
- Encouraging better-coordinated, methodical response to similar future events,
- Examine whether existing international framework sufficiently addresses the emerging IID threat.

Thank you
